

Recognition-Gated Pest-Control Patent & Business Buildout

Current patent state

- Specification v0.3: 280 numbered paragraphs; FIGS. 1-12 numerals integrated; 135-claim exemplary universe appended.
- Figures v0.1: twelve line drawings covering architecture, recognition, training, population registry/completeness, authorization, trough/feed delivery, treatment classes, audit logic and broader target animals.
- Claims v0.4: 135 working claims across 14 independent families with no ceiling.
- Filing critical path is technical disclosure and drawings, not claim pruning.

Remaining patent work

- Inventor-confirm local-population identity and completeness algorithm details.
- Resolve broad species-selective-toxicant support; do not treat sodium nitrite as exclusively pig-specific.
- Confirm reproductive-control agents/routes actually contemplated.
- Provide concrete inventor-conceived genetic-modification mechanism or narrow/defer that branch.
- Confirm representative broader target-animal embodiments and full-scope enablement.
- Perform claim-to-spec support matrix audit and formal prior-art claim charts/search.
- Revise and deliver licensed patent-counsel review package.

Post-patent business/funding program

- Derive product and service architectures directly from protected sensing, AI, population-state and delivery platform.
- Build federal opportunity pipeline across USDA/APHIS, NRCS, NIFA/SBIR-STTR and adjacent agriculture, AI, invasive-species, conservation and biosecurity programs.
- Build state/local/tribal/territorial sweep, prioritizing Mid-Atlantic and Midwest while maintaining national coverage.
- Screen selected international wild-boar/invasive-pest markets and funding programs separately from patent-filing and deployment authorization.
- Prepare partnership, pilot, NDA, data-rights, background/foreground-IP, regulatory-responsibility and commercialization documents.
